

Brewing Tanks

N & J Fabs manufacture for the brewing industry. This is from the simple singular tanks and accessories through to the full turnkey project solution for the clients site.

We manufacture the vessels to suit your individual throughput, operation size is NOT a problem whether it be a 'Sample Tank' as we call it this is for the clients who want to bring a new blend into the range already offered and wants to small test batch them first. Then the Sample tank is built as small as you want it.

The vessels are built from 304 stainless, however should other materials be required such as 316 or 321 then these can be offered too.

The brewing vessels we design and manufacture include design calculations, drawings for approval through to manufacture, transport delivery then installation. Any pipe work required is included with purge welding of the joints complete.

Brewing vessels can have a number of finishes: mirror, bead blast or brushed.

Should the product in the vessel require controlled temperatures the brewing vessels would be clad and insulated accordingly.

Due to our vast knowledge in the tank industry the Brewing Vessels can be designed to suit your requirements throughout.

The Brewing Vessels may require secondary steelwork to allow the operation to run efficiently. These can be manufactured in mild steel and powder coated or galvanised or should the area require stainless steel then this option is also available.

N & J Fabs are certified with BS EN 1090 allowing the secondary steelwork to be manufactured and installed legally.

Summary:

- Brewing vessels any size
- Designed to suit your requirements
- Designed with assistance of N & J Fabs
- Drawings for approval
- Various material types can be offered
- Material finishes – options available
- Insulate and cladding
- Pipework
- Secondary steelwork
- Installation
- Site discussions
