

Air Conveying

Along with mechanical handling conveying systems Smalley Manufacturing has supplied several air conveying systems delivering plastic components to bottle filling lines. These systems can involve single or multiple lines dependent upon the application requirements.

Smalley Manufacturing has designed and built systems with as many as 12 different color components, consisting of product roller conveyor staging conveyors, mobile tote dumper to collect each color product and dump it into the assigned receiving hoppers, hopper unloading feeders transporting product to one or multiple lines, and the air conveying systems with defusing hoppers delivering different color plastic components to their required bottling station.

Along with the aforementioned components our controls team can provide complete programing and design to assure precise inventory control and system management.
