

Damper

Damper for use in transport and handling of powders, granules, and larger items

PAM develops and produces dampers for use in transport and handling of powders and granules, as well as larger items.

The dampers are available in standard as well as stainless steel and with the possibility of manual, electrical, hydraulic or pneumatic actuation.

Our standard damper program includes a wide range of dimensions and geometries and is adapted to our lock program. If we do not have a standard damper to meet your needs, it will usually be possible to produce a customized damper (damper).
