

## Membrane Strainer

The membrane strainer is a solid liquid separation equipment using the principle of pressure feeding. It is being used successfully in almost every industrial filtration processes. It includes a series of filter / strainer plates and frames or recessed plates which are arranged alternately. A filter / strainer medium is provided in between the plates. A feeding pump is utilized to force the liquid through the medium leaving the solid trapped inside.

Because of its simplicity and flexibility, the chamber Membrane Strainer has been widely applied in clarification and dewatering applications.
