

Bevel Gears

These bevel gears are manufactured using state-of-the-art technology to meet the international quality standards. These bevel gears are helpful in changing the direction of the shaft's rotation and are widely used in valve actuator gear boxes, electrical equipments like on load tap changers, material handling equipments and motivators. The teeth of a bevel gear may be straight-cut as with spur gears, or they may be cut in a variety of other shapes. Bevel gears have the same advantages and disadvantages relative to their straight-cut cousins as helical gears do to spur gears.
