

Aluminum

When weight and durability drive design considerations, aluminum (Al) is extremely abundant and very common. An excellent thermal conductor, Al is used for various heat transfer applications. Arzon manufactures Al tubes for heater cores, charge air coolers, condensers, manifolds and radiators.

Al is also widely used in any number of industries beyond thermal transfer, including thousands of commercial and consumer products from tools to furniture.

We have multiple high frequency mills capable of producing various Al profile shapes including oval, round, rectangular and square.

To receive a fast quote on any aluminum tube profile, simply [submit your inquiry via our RFQ link](#). An Arzon representative will get back to you in less than 1 working day.
