

Spool Handling

The spools can be handled by either the core with a pneumatic gripper or by gripping around the product with padded pneumatic clamping arms depending on the application. Having the ability to free float allows for effortless and precise positioning of the spool onto unwinders or pallets.

Each lift assist is specifically designed to suit the product handled. We will work with your team to ensure our design is well suited for your application. Starquip's main design criteria is to keep it simple, safe and easy to use. We have several proven design techniques that are and have been functioning in the field for several years.
