

Ribbon Blender.

we are manufacturing ribbon blenders which are designed for efficient and homogeneous mixing of different ingredients and formulations. In this ribbon blender, curved horizontal ribbon blades lift and tumble material while conveying to the center of the mixer drum where they are continuously overlapped and cross blended. In this ribbon blender, material goes through upward and downward movements and also there is a cross blending action. The material is thus mixed thoroughly and homogeneously.

These ribbon blenders are extremely useful in chemical industries, ayurvedic formulation (duheri churna and trifala chuma), pharmaceutical industries, pesticides and fertilizer and food processing industries and other industries. These are manufactured in a range of 25kg to 1000 kg batch capacity in m.s. And s.s.

Following are some its salient features:

- 1) due to the unique design of the ribbon blender the time required for mixing is shortened.
- 2) there is no dust formation while mixing

the quality of raw material and the provision of efficient gear box results in lesser maintenance cost and much less service after sales.

Roaster:

We fabricate a vast range of mini roasters, used for the parching and roasting of grains, cereals and nuts. Apart from that mini roasters can effectively eliminate humidity from the grains. In order to make other finished products like crushers, decorticators and energy food from grains; other suitable equipments are required as roasters are meant for roasting only
