

## Inverter Transformer

Everyone hates the Power shutdown. Thanks to the Inverters. They have become an integral part of almost all houses by serving as an alternative power source. And as far as factories and businesses are concerned, Inverters are inevitable.

EVR Power's Inverter transformers are intended to support applications that consist of inverter circuits. These transformers combine the functionality of an inverter with a transformer. The inverter converts direct current (DC) to alternating current (AC) at a low voltage, and the inverter transformer is used to step up that low voltage to a higher level that is generally required by the electrical equipment or appliances for operation.
