

Ribbon Blenders

Our organization is counted amongst the most distinguished manufacturers, suppliers and exporters of a commendable array of ribbon blander. Ribbon blenders consist of a u-shaped horizontal trough and a specially fabricated ribbon agitator. A ribbon agitator consists of a set of inner and outer helical agitators. The outer ribbon moves materials in one direction and the inner ribbon moves the materials in the opposite direction. The ribbons rotate at approx. 300 rpm moves materials both radically and laterally to insure thorough blends in short cycle times.

An alternate agitator is our paddle design. The paddles are positioned to move materials in opposing lateral directions and radically. The paddle design is normally applied where friable materials are being blended and when batches as small as the total capacity are going to be mixed in one blender.
