

Leaf Chains

Leaf chains: these are known for their durability and high tensile strength and They are primarily used in lift device applications such as forklifts, lift trucks, and lift masts. These hard working chains handle the lifting and balancing of heavy loads with the use of sheaves instead of sprockets for guidance.

One of the primary differences with leaf chain compared to roller chain is that it only consists of a series of stacked plates and pins, providing superior lifting strength.

- All size available in brands –
- Indian :- BCLT / Diamond
- Japanese :- Senqcia
