

## Belt Cleaners

A multi cleaner system (Primary & secondary) adopted by Polysteel® products has become a common standard for all pattern of conveyors & its cleaning systems.

Following are the basic factors which need to be known before implementing on the selection of scrapper and its mounted tips for efficient cleaning-

- Kind of material to be cleaned.
- Lump size of the material.
- Moisture content in the material.
- Is there any scrapping idler installed.
- Is there any joint on the belt which is being protruded which may damage the scrapper or reduces the life of scrapper

### Some Important Parameters Which Helps In Improving the System

- Highly abrasion resistant blades for all type of material conveyed
- Suitable for all belt widths & speeds
- Excellent durability
- Low space requirements due to compact design
- Helps in increasing conveyor efficiency
- Increases life of belt
- Helps in avoiding spillage over the length of conveyor
- Less maintenance
- Optimum belt protection
- Low operation cost
- Self alignment with belt due to elasto mount technique
- Due to effective cleaning it also helps in reducing the ampere load
