

## Air Slides

Airslide conveyors are used to convey a great variety of fine-grained bulk solids at a very low speed. They are used for multiple materials like Fly Ash, Gypsum, Iron Powder or Cement. Highly capable of carrying pulverized raw material over long distances, this conveying system is very efficient in its working. They work on the principle of fluidizing the base of materials' layer by supplying pressurized dry air through the synthetic cloth. Intech Engineers is known for being one of the prominent Air Slide Manufacturers in Noida. These slides are better than other forms of conveying because of zero routine maintenance, easy mounting and low energy usage.

### Unique Features Of Our Air Slides Conveyor

- High capacity which goes up to 800 tph of dry powdery materials
- High-grade mild steel used for manufacturing
- Big sized top covers for effective ventilation
- Dust emission-free functioning
- Easy to install even when there are problems of space
- Low cost for installation, repair and maintenance
- Ideal for conveying material downwards
