

Cockle Cylinder

Cockle cylinder machine consists of steel drum into which thousands of small indents are pressed. **Industrial Cockle Cylinder Machine** is made in such a shape of indents as to trap only particular size seed. Drum rotates slowly and grain to be graded is feed inside. Paddles are fitted to spread the grains over a wide area. The entrapped grains broken, cockles are separated and discharged by a screw conveyor and machine guarantees total separation of broken grains and cockle.

Salient Features of Cockle Cylinder Machine:

1. Compact construction body.
2. Less power consumption.
3. Easy in installation.
4. Total separation of broken grains and cockle.
