

# Emery Roll

Emery roll machine with dynamically balanced rotor is used in removing the outer hull or husk layer of various pulses and guar seeds. **Industrial Emery Roll Machine** is equipped with static and dynamically balanced rotor. It performs dehusking by friction of pulses between dehusking roll and perforated screen inside the machine. It ensures high dehusking efficiency and ensures less breakage of product.

## Salient Features of Emery Roll Machine:

1. Used in removing the outer hull or husk layer of various dal and guar seeds.
2. Dehusking takes place by friction of pulses between dehusking roll and perforated screen inside the machine.
3. Conditioned pulses easily get dehusked with less broken.
4. High percentage of gota or whole dal without skin can be recovered by this machine.
5. Easy installation.
6. High dehusking efficiency.
7. Clearance between rotor and screen is precisely set to get best results and is adjustable.
8. Less breakage of product.
9. Rotor is static and dynamically balanced by CNC balancing machine.
