

Leaf Separator

The Allround vegetable processing leaf separator machine separates leaves from carrots in a very careful manner. This is done by a rotating belt to which leaves attach. The rotating belt is placed at a steep angle, which causes the leaves to be transported upwards, and the heavier product to fall down. After the products are separated from the leaves, the product can be transported using a transport belt, or directly into an Allround machine.

LS 80-110

Total width machine	800 mm
Total length machine	1100 mm
