

# Engine Valve

Engine valves are made from a wide range of standard materials such as low carbon steel, martensitic & austenitic grades of valve steels and super alloys like inconel steel, nimonic steel and other materials

At Quintess International we offer various configurations, special coatings and treatments to enhance engine valve performance and durability.

Engine Valve seats are solidly built to improve exhaust strength, chrome-plated to improve wear resistance, and Stellite (Seat Hard Faced) to achieve high hot hardness at the seat. In addition, we provide our clients with unique solutions.
