

# Automation Valve

Asten Control is a leading Automation Valve manufacturer, supplier and exporter in India. We are capable to develop ball valve suited for any industry as per customer requirement. In automation ball valves, actuator is operated by electrical motor. User can request any type of automation valve whether they are searching for Electrical Ball Valve, Pneumatic Ball Valve, Manual Ball Valve, steam or high temperature valve. Our offered Automation valves are durable and energy efficient, consume minimum electrical energy for opening and closing of valve and can easily control gas, water, steam, mud, oil, liquid metal and other liquid flow. That is why they are very useful control valves for heating systems.

We develop automation ball valves for automation of various process control services. They are compact, corrosion proof and light weight, available with CPVC, SS, MS, PVC, Polypropylene and other material construction. Now demand of these 2 way automation ball valve is growing to fulfil many on off and switching purpose in pipeline applications. For managing valve switching action, it uses electrical power to drive valve through actuator. These electrical valves are power open and power close type and can rotate on the angle of 90 degree from open to close position. Its actuating force distance is bigger than any other valve and hence comparatively slow then air operated pneumatic valve but we can adjust valve actuating speed. Known as one of the top **automation valve manufacturer**, we offer 2 way & 3 way ball valves on market leading prices.
