

Hammer Mill

The most versatile machine that is used to grind almost all materials like spices, foodstuffs, chemicals, ayurvedic herbals, minerals, and other miscellaneous materials.

The grinding takes place between the high-speed swinging hammers and top/side liners. Once the particle size reduces to that of the perforated screen at the bottom, it will be discharged through the hopper.

The fineness of the material can be controlled by changing the speed of the rotor (hammer), the content of serrations on liners, the number of hammers and diameter of perforation on the screen.
