

Twin Spindle

Twin spindle machine is designed to meet the production demands of the customers. For those who require only one job for their product i.e. either cutting or trimming or beading operation, we have reduced cycle time.

The machine does a single operation on two separate stations which reduce the loading and unloading time to zero.

By the time one operation is being done on one station, unloading and loading can be done at the other station. So the machine is not idle for any instance. This way even with manual loading and unloading of the component, the operator can do about 16-18 components in a minute depending upon your product's cycle time operation.
