

# Conveyor System

**Conveyor system** also called as parcel conveyors are an economical and efficient way to move items and facilitate material handling in a facility without manual help. **Conveyor system** move thousands of items per hour and when used in parallel, they can achieve almost unlimited handling rates.

In automated fulfilment centers, distribution centers and warehouse automation operations where different material handling components are connected together in one cohesive warehouse automation systems, conveyers usually serve as the spine or backbone of the operation, handling different processes such as transportation, accumulation, elevation between levels and sortation.

**Conveyor system** can carry almost anything that can be placed on them individually and are used in wide range of warehouse functions.

## *Conveyor System Features*

- Decreased friction
- Significant in airport baggage handling
- Long service life
- Rugged structure for suitable performance
