

Cyclone Separator

Cyclone separators is one of many air pollution control devices known as pre-cleaners since they generally remove larger pieces of particulate matter as name suggests, these are the separation devices to segregate particulate matter from flue gases. It uses the principal of inertia to do so.

All these products are constructed with high grade materials that make them capable of withstanding wide temperature and pressure range in industries

Technical Specification:

- Simple Construction with no moving parts
- Low pressure drops
- Low energy consumption
- Low Operational cost
- Ability to handle extremely high dust concentrations
